Scope of Study

Summary: The basic purpose of the National Health Interview Survey (NHIS) is to obtain information about the amount and distribution of illness, its effects in terms of disability and chronic impairments, and the kinds of health services people receive. Each year, the National Center for Health Statistics conducts the NHIS, a personal interview household survey that uses a nationwide sample of the civilian, noninstitutionalized population of the United States. The NHIS includes a core set of questions that remains virtually unchanged across years on a variety of sociodemographic and health-related concerns. In addition, one or more current health topics is selected for special emphasis annually. In 1989, the NHIS included an extensive set of questions, asked of each identified and self-confirmed adult diabetic in an interviewed family, on dietary practices, health care usage, use of medication, and other related subjects. In addition, in half of the responding families, an adult sample person was randomly selected to respond to a series of questions on diabetes risk factors. If the selected sample person was a diabetic, the questions were asked within the context of the detailed questions on diabetes health practices and knowledge mentioned above. This collection also contains data from the basic questionnaire (see NATIONAL HEALTH INTERVIEW SURVEY, 1989 [ICPSR 9583]), including age, sex, race, marital status, education, veteran status, income, family relationship, self-reported health status, and activity limitations, and the number of bed days, doctor visits, and hospital stays in the previous year.

Subject Term(s):	chronic disabilities, chronic illnesses, diabetes, diet, disabilities, health, health care, health care services, health problems, health services utilization, illness, medical care, medical history, medications
Geographic Coverage:	United States
Time Period:	<ul style="list-style-type: none">• 1989
Date(s) of Collection:	<ul style="list-style-type: none">• 1989
Universe:	Civilian, noninstitutionalized population of the United States.
Data Type:	survey data
Data Collection Notes:	Per agreement with NCHS, ICPSR distributes the data file(s) and technical documentation in this collection in their original form as prepared by NCHS. The age distribution for this file is: 18-24 (N = 11,362), 25-44 (N = 36,688), 45-64 (N = 22,277), 65-69 (N = 4,788), 70-74 (N = 3,830), and 75+ (N = 5,627).

Methodology

Sample:	Multistage probability sample.
Data Source:	personal interviews

Access and Availability

Note:	A list of the data formats available for this study can be found in the summary of holdings . Detailed file-level information (such as record length, case count, and variable count) is listed in the file manifest .
Restrictions:	In preparing the data tape(s) for this collection, the National Center for Health Statistics (NCHS) has removed direct identifiers and characteristics that might lead to identification of data subjects. As an additional precaution, NCHS requires, under section 308(d) of the Public Health Service Act (42 U.S.C. 242m), that data collected by NCHS not be used for any purpose other than statistical analysis and reporting. NCHS further requires that analysts not use the data to learn the identity of any persons or establishments and that the director of NCHS be notified if any identities are inadvertently discovered. ICPSR member institutions and other users ordering data from ICPSR are expected to adhere to these restrictions.
